

## Lettering & layer kinds

Two additions to the v3.0 workspace: kind badges in the layer list (violet = balloon, amber = caption, gray = art — always color + label, never color alone) and a focused Lettering mode — a DaVinci-style page switch with a balloon rail, per-language text, and AI generation with a visible on-device / cloud routing indicator. Shown for macOS, iPad and iPhone.

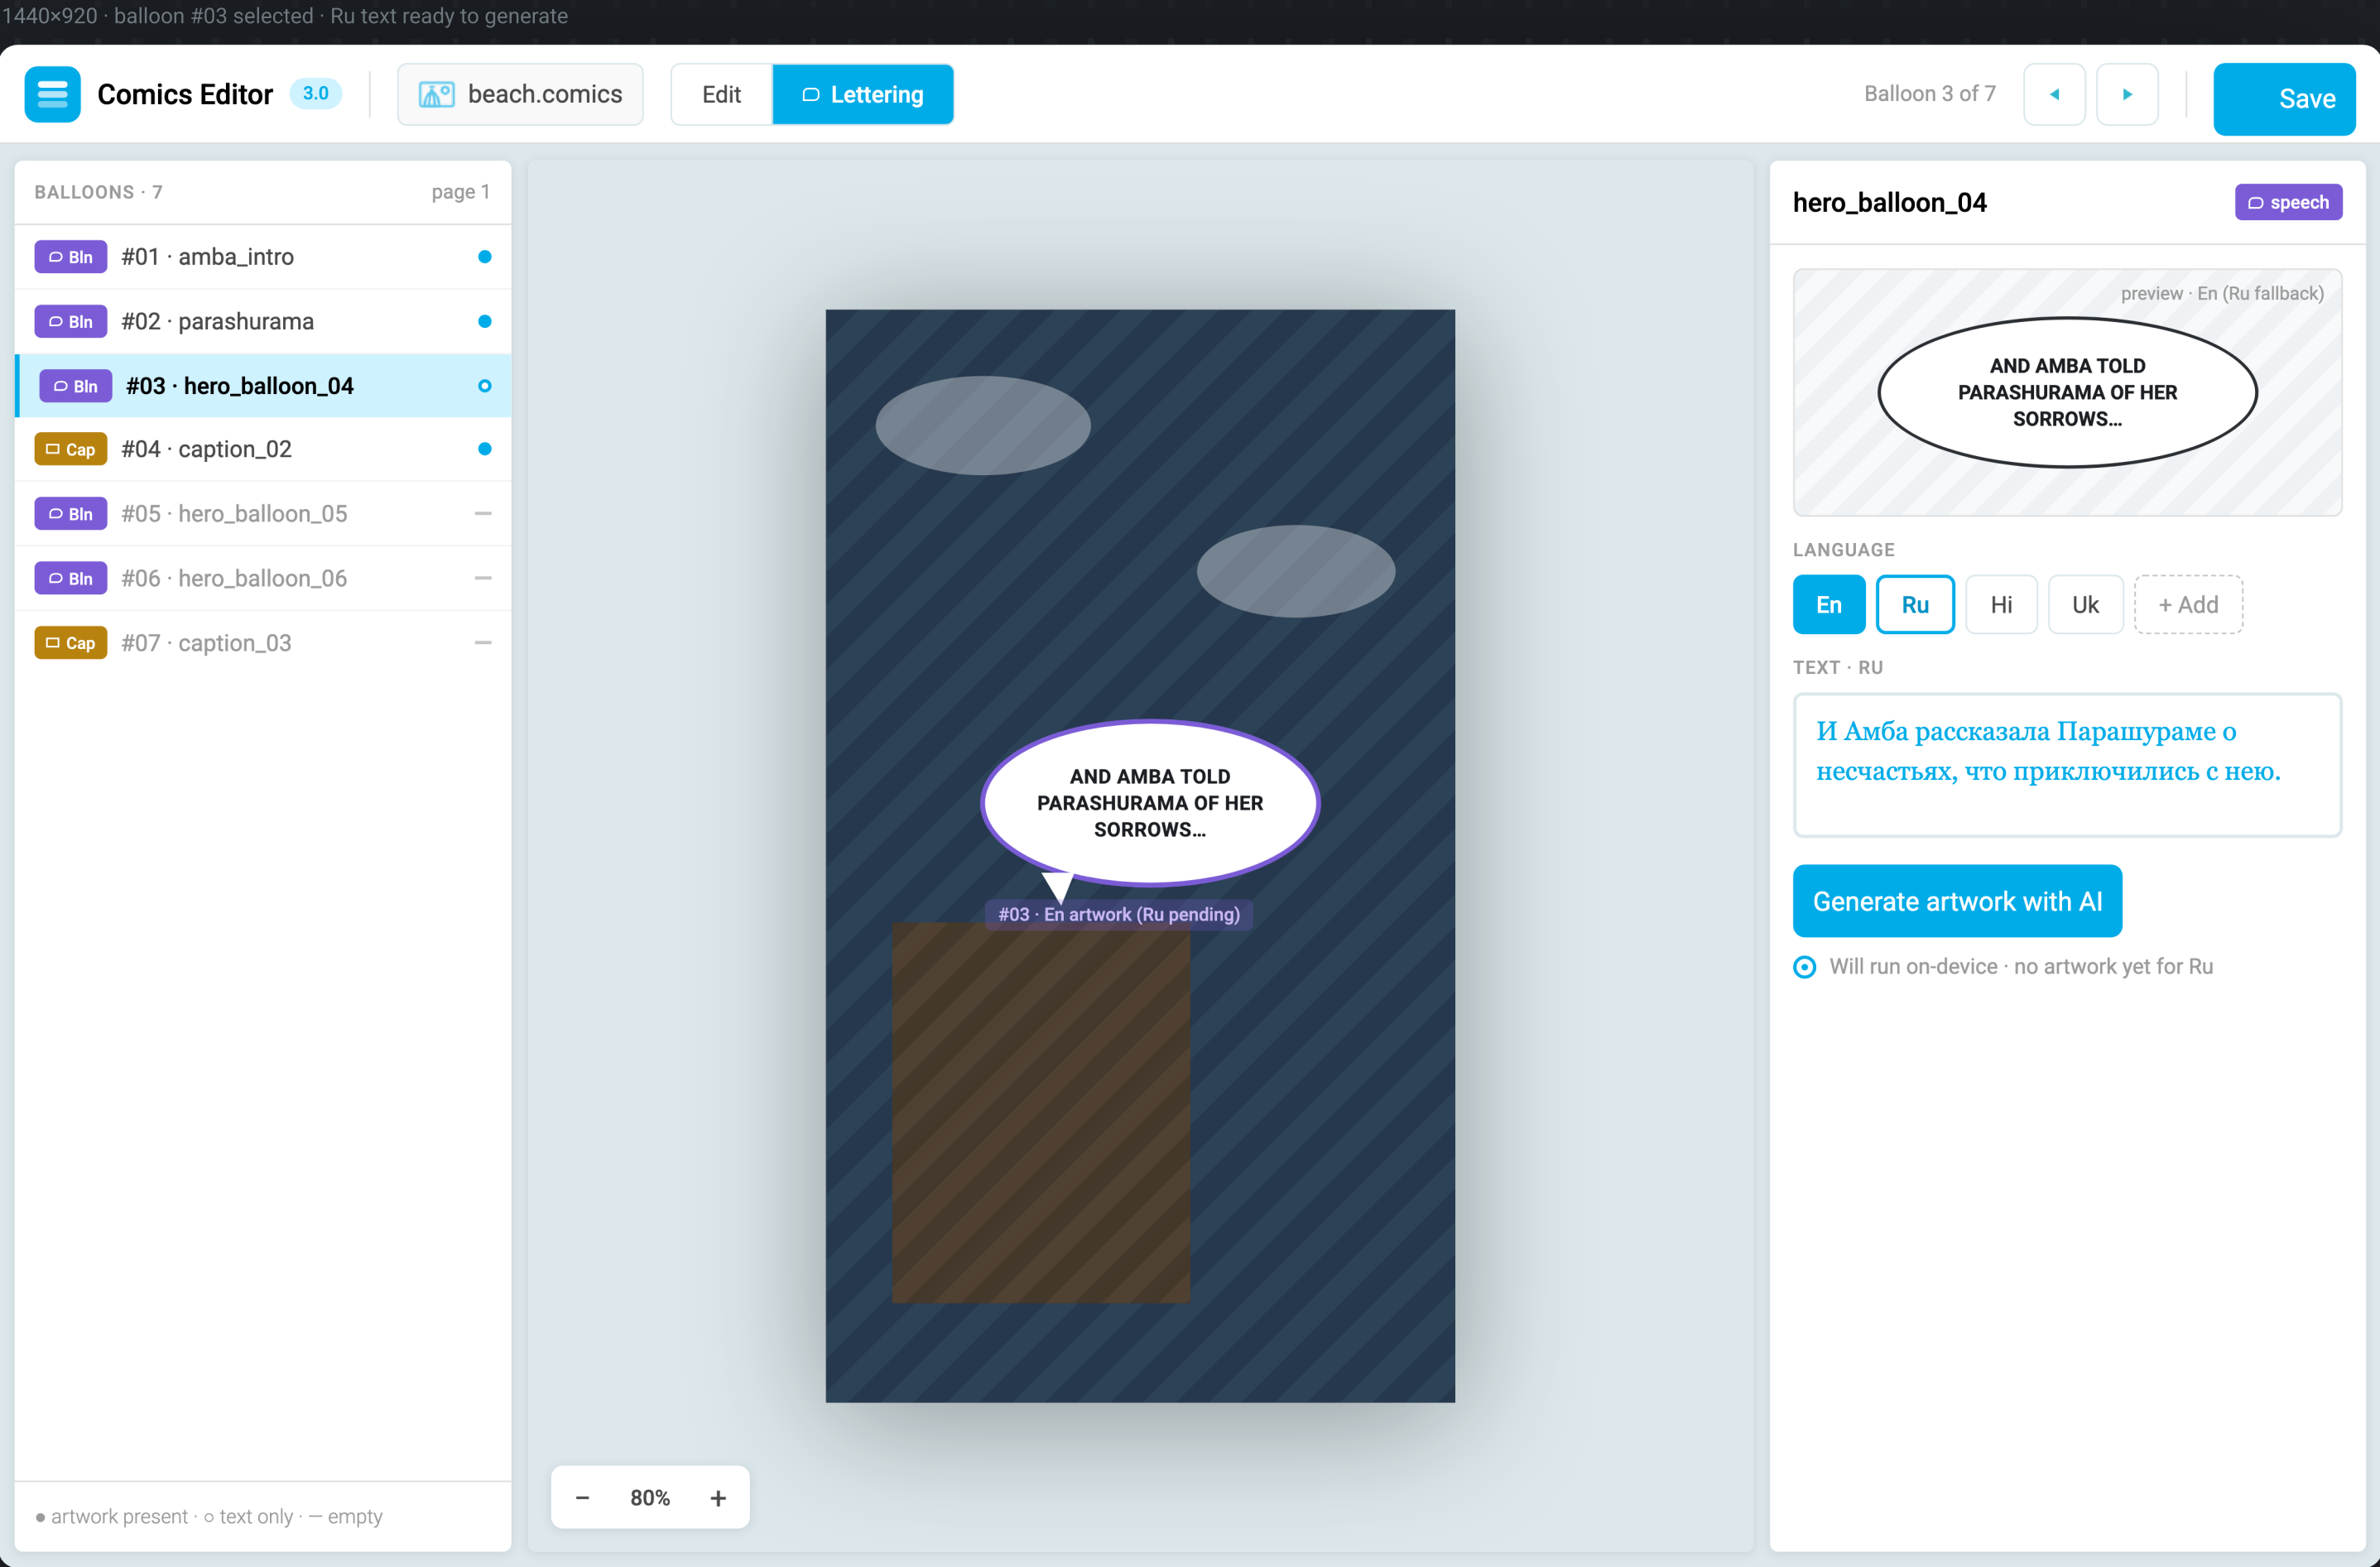

### Layer-kind badges — Scene panel

A small kind chip before the thumbnail, everywhere the layer list appears. Legacy files with no kind field render exactly as today.

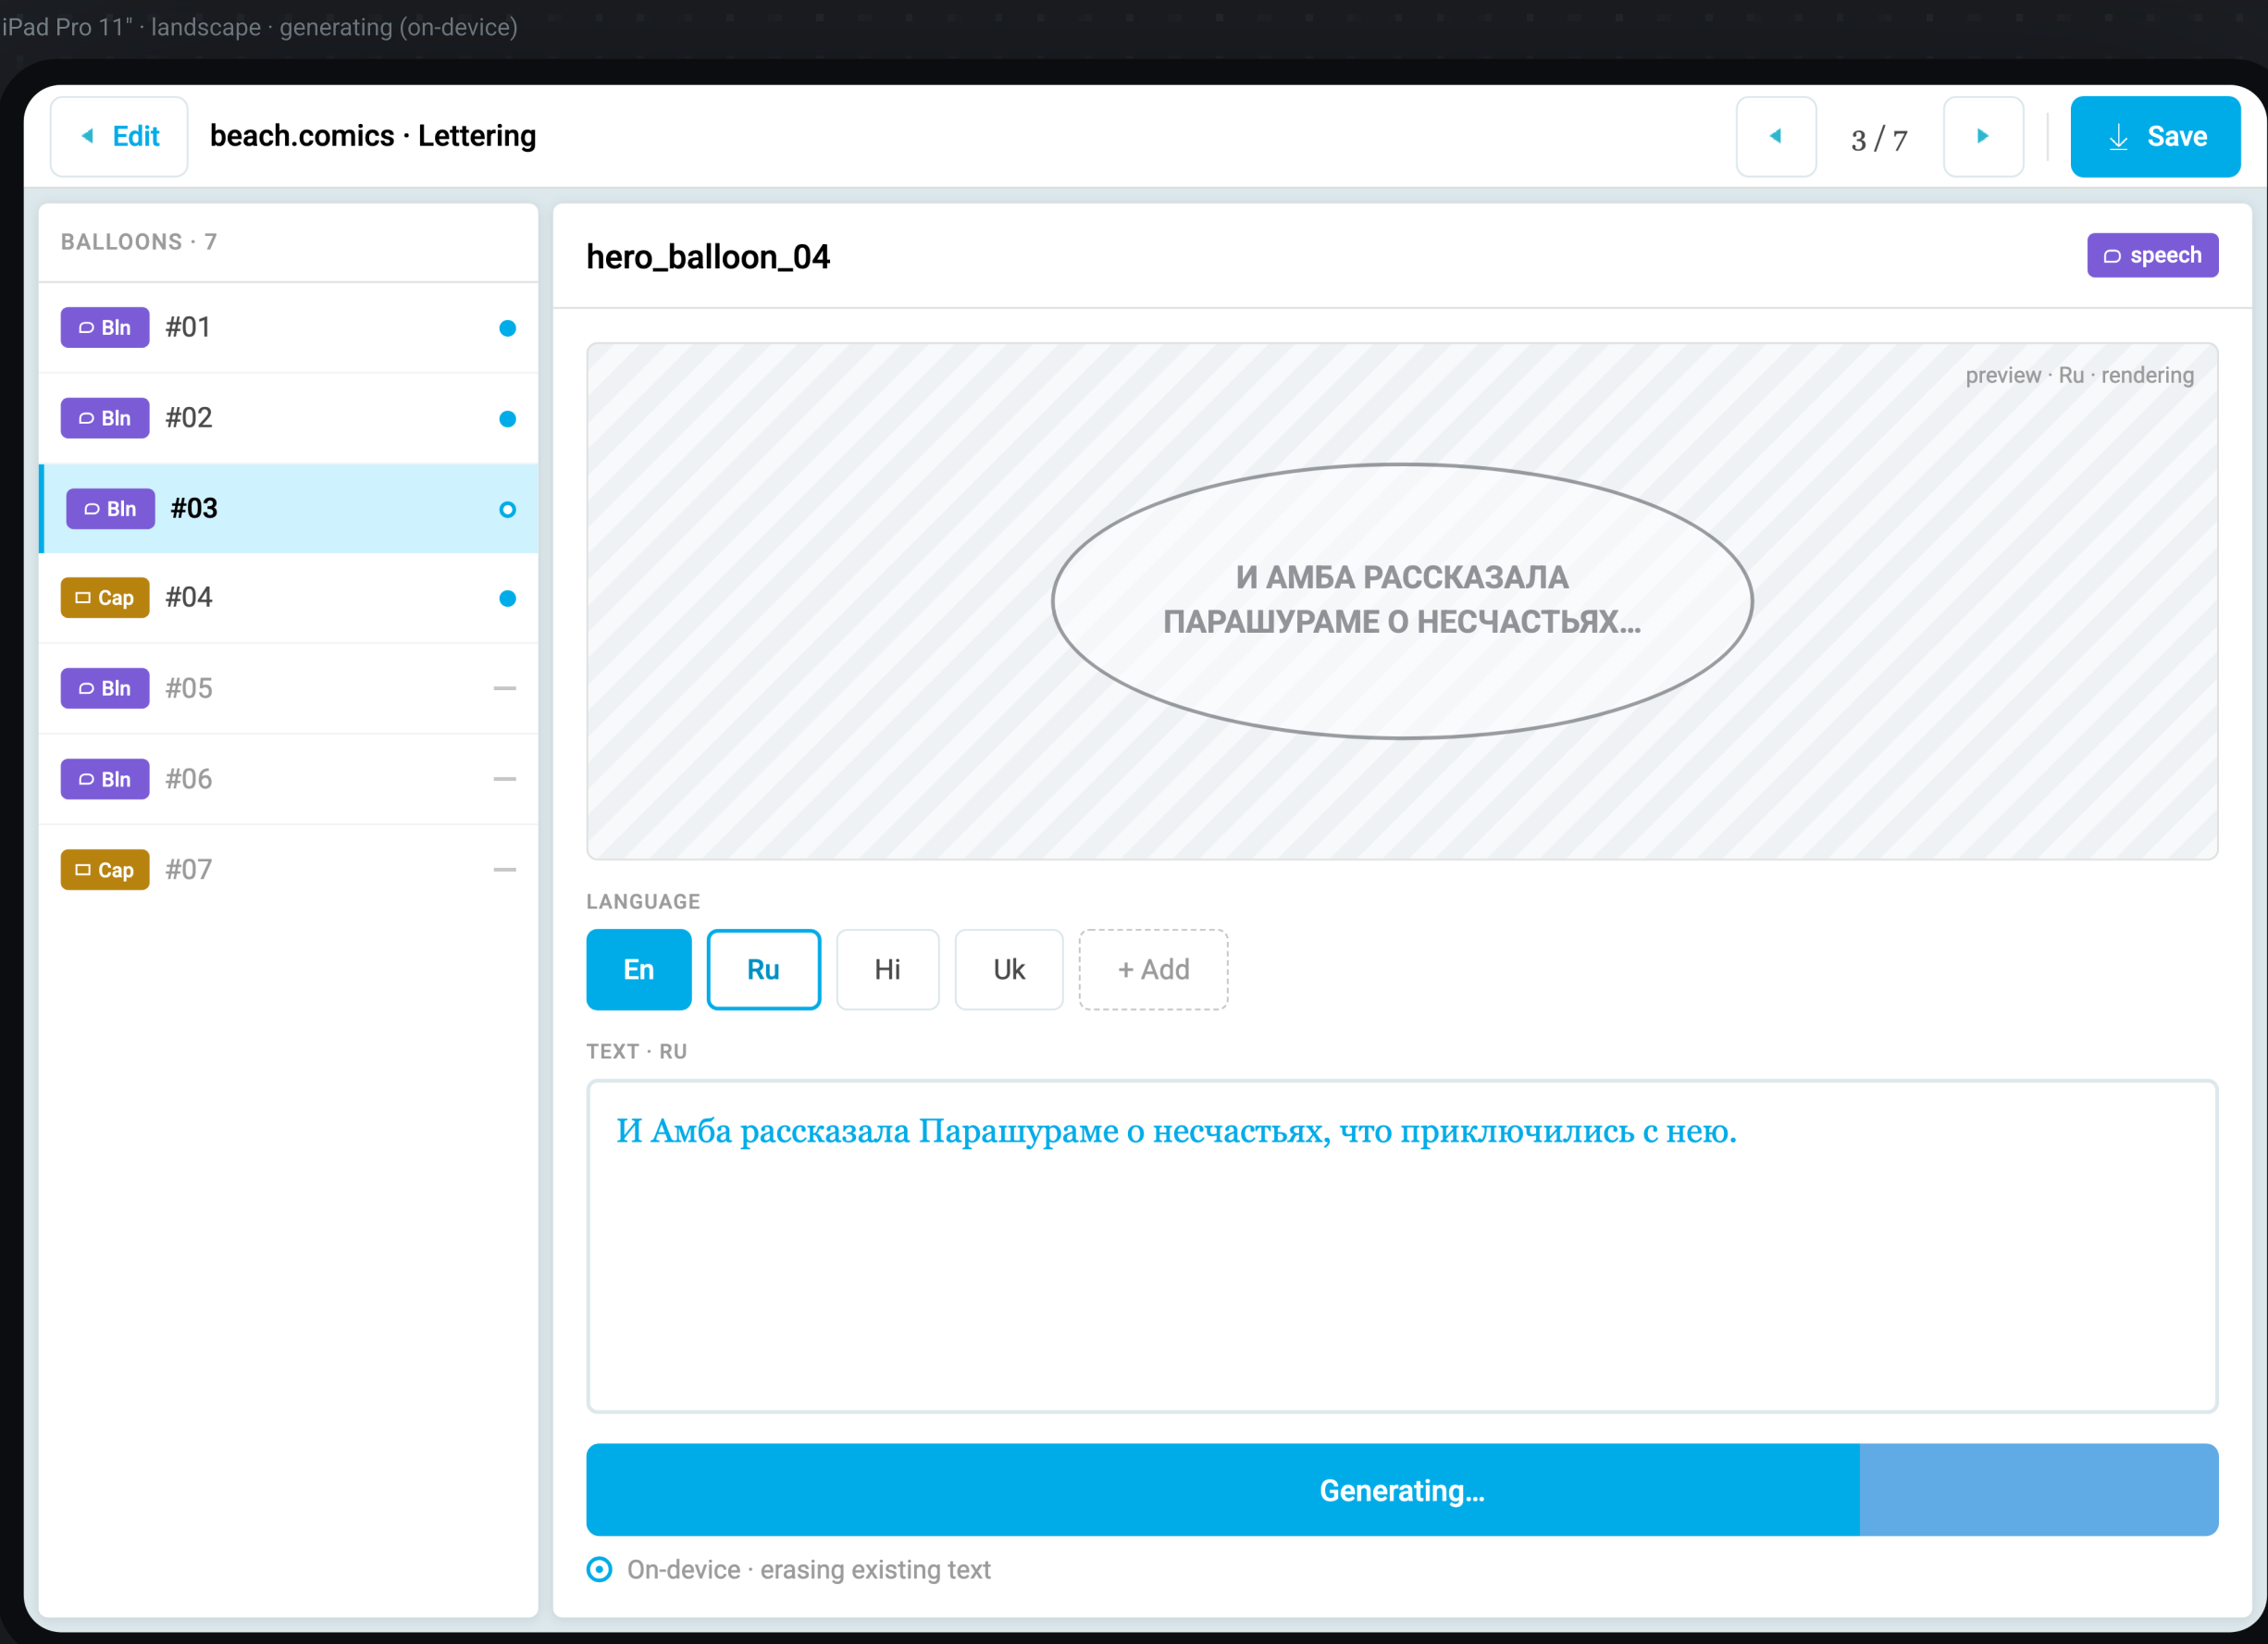

### Lettering mode — macOS

Same three-pane frame: balloon rail replaces Scene, balloon editor replaces Properties, canvas shows the current balloon in page context. Mode switch in the top bar.

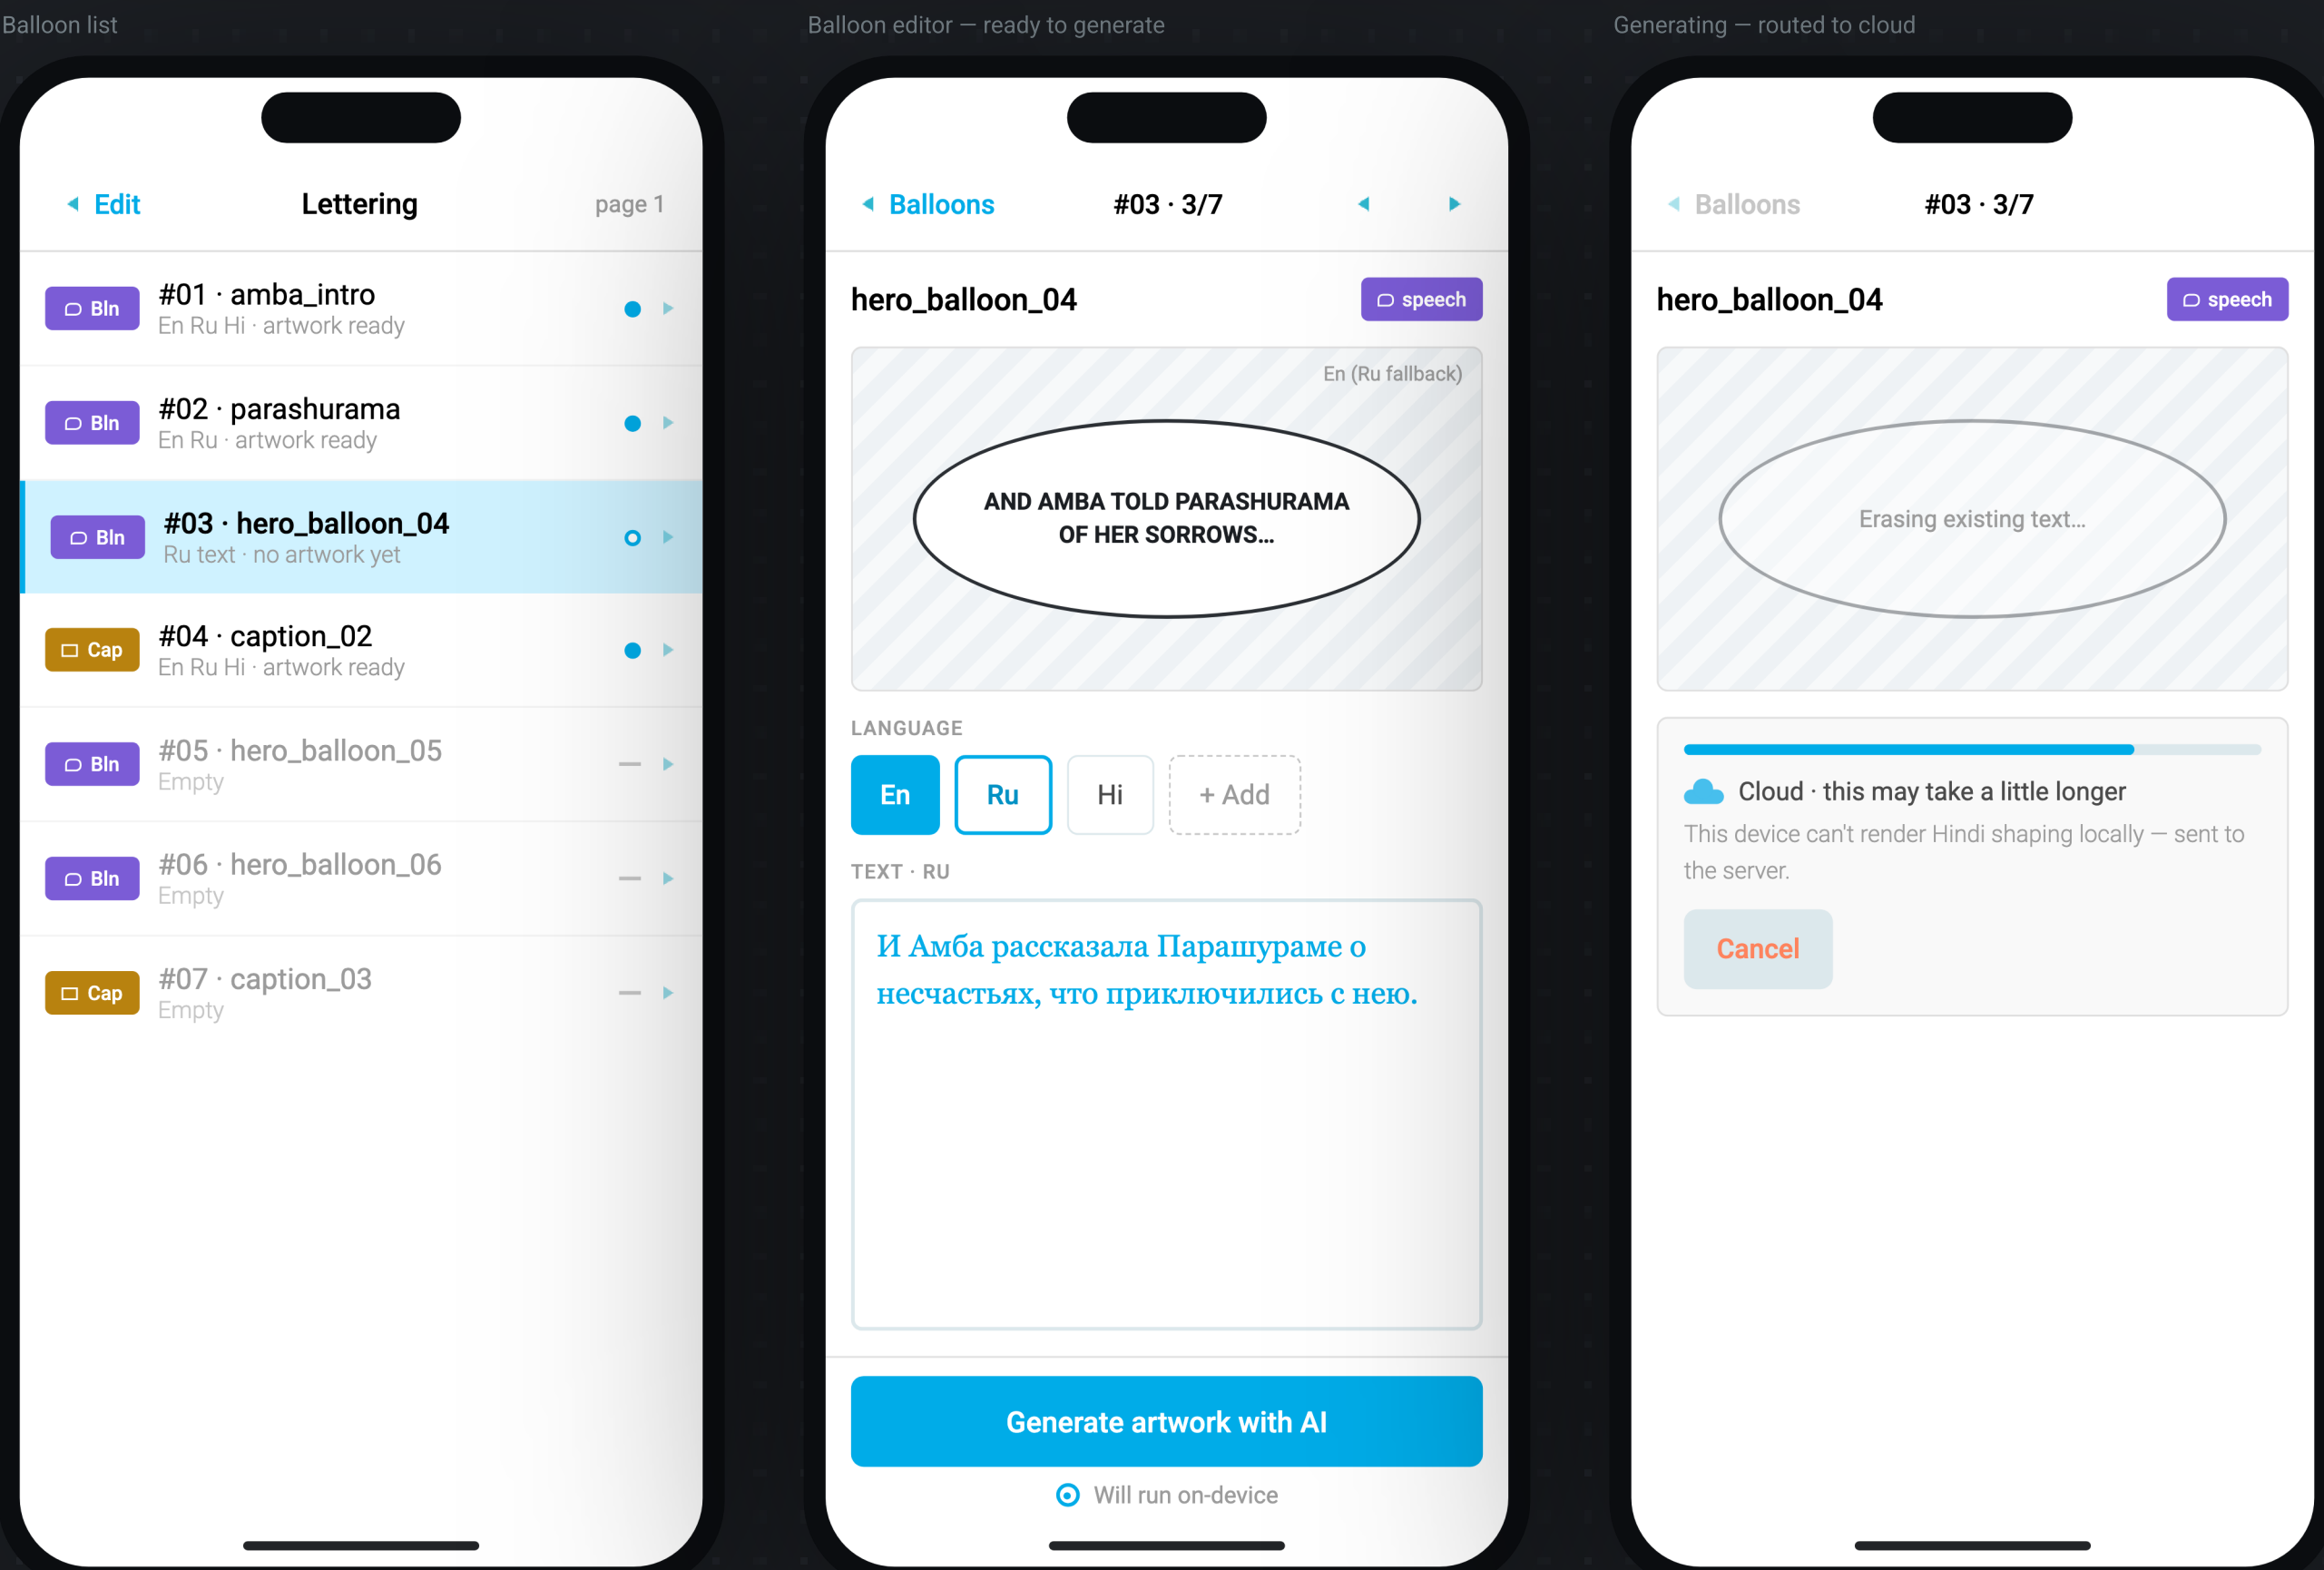

### Lettering mode — iPad landscape

Primary target. Two panes — balloon rail + large touch/stylus editor. No page canvas here; the preview stands in 44px targets throughout.

### Lettering mode — iPhone

Single column; balloon list is a screen, the editor is a screen. Same shallow depth — one tap from list to editable balloon; swipe or arrows to step.

### Balloon editor card — states

One reusable component — hosted in Lettering mode, or collapsed inside the Edit-mode Properties panel. Routing indicator is always visible during generation.
